

Interview Notes

1. Tools Used During the Choreography Process

- Used **Google Slides** to design and share formations.
- Also used a formation-planning application called **Arrange Us**.
- Google Slides was useful because members could access the slides later and reference their positions independently.

2. Time Required to Design Formation Changes

- The formation-design process took approximately **5–8 hours in total**, spread across several days.
- The process was time-intensive because each performance included roughly **20–30 formations**.
- Additional time was needed to determine how each formation should look and how dancers should transition between positions.

3. Collisions and Positioning Errors During Rehearsals

- Because this was the choreographer's first time designing formations, several collisions and movement-path errors occurred during rehearsal.
- Some dancers did not exit or move through the formation correctly.
- The choreographer typically reviewed and simulated the transitions before rehearsal, which helped reduce errors.
- When collisions occurred, the choreographer and dancers worked together to identify clearer movement paths.
- A formation-planning application would be valuable because it could visually simulate how dancers move, rather than requiring the choreographer to imagine every transition mentally.

4. How Formation Revisions Were Communicated

- Formation changes were primarily communicated during rehearsals.
- After a revision, the group practiced the updated transition several times to ensure everyone understood and remembered it.
- Updated Google Slides were sometimes shared so members could review their positions outside rehearsal.
- Changes were communicated sequentially, from one formation to the next, to help dancers understand the complete transition.

5. Most Time-Consuming Step

- The most time-consuming part was **designing the formations themselves**.
- Particular challenges included:
 - Dividing the center section evenly.
 - Making each formation visually distinct.
 - Creating smooth and logical transitions between formations.

- Ensuring the final formations produced the intended visual effect.
- Considerable time was spent balancing creativity, spacing, and transition flow.
